## Special layout models

Chapter 7 (Warehouse Operations)
Chapter 10 (Facility Planning Models)

Machine layout model
Storage layout planning
Warehouse layout model

## Machine Layout Models

- Objective:
- To arrange machines on the shop floor in such a way so that the total cost is minimal.
- So far, the layout models were aggregate in nature
- Machine layout models address additional issues:
- The interface points for incoming and outgoing parts for individual machines are usually at fixed locations (pick-up and delivery locations) relative to the entire work envelop of the machine
- Minimum space between machines must be provided to accommodate access to machines for maintenance and service, and allow enough space for material handling devices and in-process storage areas

# Machine Layout Models Basic layout patterns 

Single-Row Machine Layout

Double-Row Machine Layout

Multi-row Layout

## Single row machine layout model

Let
$x_{i}^{P}=$ location of pick-up point of machine $i, i=1,2, \ldots n$
$x_{i}^{D}=$ location of delivery point of machine $i$
$w_{i}=$ width of machine $i$ oriented parallel to the aisle
$a_{i j}=$ minimum clearance between machines $i$ and $j$
$c_{i j}=$ cost per trip per unit distance from machine $i$ to $j$
$f_{i j}^{L}=$ total loaded material handling trips from machine $i$ to machine $j$
$f_{i j}^{E}=$ total empty (deadhead) material handling trips from machine $i$ to machine $j$

## Single row machine layout model

The single-row model formulation is as follows:

$$
\text { Minimize TC }=\sum_{i=1}^{n} \sum_{j=1}^{n} c_{i j}\left(f_{i j}^{L} d_{i j}^{L}+f_{i j}^{E} d_{i j}^{E}\right)
$$

The objective function gives the total cost of material handling where

$$
\begin{array}{rlr}
d_{i j}^{L} & =\left|x_{i}^{p}-x_{j}^{D}\right|, & \\
\text { loaded travel distance } \\
d_{i j}^{E} & =\left|x_{i}^{D}-x_{j}^{P}\right|, & \text { empty (deadhead) travel distance }
\end{array}
$$

These constraints ensure the required distance between workstations:

$$
\begin{aligned}
& \left|x_{i}^{P}-x_{j}^{D}\right| \geq \frac{1}{2}\left(w_{i}+w_{j}\right)+a_{i j}, i=1,2, \ldots, n-1 \\
& j=i+1, \ldots, n \text { for loaded trips, and } \\
& \left|x_{i}^{D}-x_{j}^{P}\right| \geq \frac{1}{2}\left(w_{i}+w_{j}\right)+a_{i j}, i=1,2, \ldots, n-1 \\
& j=i+1, \ldots, n \text { for deahead trips }
\end{aligned}
$$

## Single row machine layout model

## Simplified single row machine layout model Assumptions

- We will assume that pick up and delivery point for each machine is located at the midpoint along the edge of the machine work area parallel to the aisle. $\quad x_{i j}^{P}=x_{i j}^{D}$
- Loaded and deadhead distances are the same

$$
d_{i j}=d_{i j}^{L}=d_{i j}^{E}
$$

- We further assume that loaded and deadhead trips are the same

$$
f_{i j}=f_{i j}^{L}+f_{i j}^{E}
$$

## Simplified single row machine layout model Minimum distance

The minimum distance between Machine 1 and Machine 2:

$$
\min d_{i j}=\frac{w_{i}+w_{j}}{2}+a_{i j}
$$

## Simplified single row machine layout model Solution

- Determine the first 2 machines ( $\mathrm{i}^{*}$ and $\mathrm{j}^{*}$ ) to enter the layout by computing max $c_{i j}{ }^{*} f_{i j}$
- Place $i^{*}$ and $j^{*}$ adjacent to each other. There is no difference between the placement order $\mathrm{i}^{*}-\mathrm{j}^{*}$ or $\mathrm{j}^{*} \mathrm{i}^{*}$.
- Place the next machine $\boldsymbol{k}^{*}$ in the layout. Decide whether $\mathrm{k}^{*}$ will be located to the left side or to the right side of the set of machines already in the layout, based on Relative Placement Cost (RPC).

$$
R P C=\min _{k \in U}\left\{\sum_{i \in A} c_{k i} f_{k i} d_{k i}, \sum_{j \in A} c_{j k} f_{j k} d_{j k},\right\}
$$

- where A...set of all located machines
U...set of all machines not yet located
- Continue until all machines are located.

## Simplified single row machine layout model Example

- Four machines should be located in a department along an aisle. The dimensions of the machines and the material handling trips between them are given below. Consider $\mathrm{c}_{\mathrm{ij}}=1$ and $\mathrm{a}_{\mathrm{ij}}=1$
> Decide about the placement order.
> Calculate the total cost for the optimal placement.

Number of trips
Machine dimensions

| Machine | 1 | 2 | 3 | 4 |
| :--- | :---: | :---: | :---: | :---: |
| Dimensions | $2 \times 2$ | $3 \times 3$ | $4 \times 4$ | $5 \times 5$ |

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | - | 10 | 5 | 6 |
| $\mathbf{2}$ | 8 | - | 3 | 8 |
| $\mathbf{3}$ | 7 | 9 | - | 4 |
| $\mathbf{4}$ | 5 | 11 | 13 | - |

## Simplified single row machine layout model Example

- Transform the From-To chart into Flow-Between chart.

Number of trips

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | - | 10 | 5 | 6 |
| $\mathbf{2}$ | 8 | - | 3 | 8 |
| $\mathbf{3}$ | 7 | 9 | - | 4 |
| $\mathbf{4}$ | 5 | 11 | 13 | - |

Number of trips

- Determine the first 2 machines ( $i^{*}$ and $j^{*}$ ) to enter the layout by computing $\max c_{i j}{ }^{*} \mathcal{F}_{i j}$

$$
\max c_{i j}{ }^{*} f_{i j}=19
$$

- First two machines to enter the layout will be 2 and 4
- $A=\{2,4\}$ and $U=\{1,3\}$

## Simplified single row machine layout model Example

- Evaluate the possible placements of the machines 1 and 3:
- Options:
- Machine 1:
- From the left: 1-2-4
- From the right: 2-4-1
- Machine 3:
- From the left: 3-2-4
- From the right: 2-4-3

Flow-between matrix

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | - | 18 | 12 | 11 |
| $\mathbf{2}$ |  | - | 12 | 19 |
| $\mathbf{3}$ |  |  | - | 17 |
| $\mathbf{4}$ |  |  |  | - |

- 1-2-4
- $R P C=f_{12} d_{12}+f_{14} d_{14}=18 * 3.5+11 * 8.5=156.5$

- 2-4-1
- $R P C=f_{21} d_{21}+f_{41} d_{41}=18 * 9.5+11 * 4.5=220.5$

Flow-between matrix

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | - | 18 | 12 | 11 |
| $\mathbf{2}$ |  | - | 12 | 19 |
| $\mathbf{3}$ |  |  | - | 17 |
| $\mathbf{4}$ |  |  |  | - |

- 3-2-4
- $R P C=f_{32} d_{32}+f_{34} d_{34}=12 * 4.5+17 * 9.5=215.5$
- 2-4-3

- $R P C=f_{23} d_{23}+f_{43} d_{43}=12 * 10.5+17 * 5.5=219.5$

## Simplified single row machine layout model Example

$$
\begin{array}{r}
\circ \mathbf{1 - 2 - 4} \boldsymbol{\rightarrow} \mathrm{RPC}=156.5 \\
\circ \mathbf{2 - 4 - 1} \boldsymbol{\rightarrow} \mathrm{RPC}=220.5 \\
\circ \mathbf{3 - 2 - 4} \boldsymbol{\rightarrow} \mathrm{RPC}=215.5 \\
\circ \mathbf{2 - 4 - 3 \boldsymbol { l }} \mathrm{RPC}=219.5
\end{array}
$$

- The min RPC is for order $\mathbf{1 - 2 - 4}$
- Evaluate the possible placements of the machine 3:
- Options:
- From the left: 3-1-2-4
- From the right: 1-2-4-3

- 1-2-4-3
- $R P C=f_{13} d_{13}+f_{23} d_{23}+f_{43} d_{43}=430$
- The final placement order is 3-1-2-4.

5m

Flow-between matrix

- Total cost calculation:

$$
\begin{aligned}
& \text { - TC=18*3.5+12*4+11*8.5+12*7.5+ } \\
& +19 * 5+17 * 12.5=602
\end{aligned}
$$

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | - | 18 | 12 | 11 |
| $\mathbf{2}$ |  | - | 12 | 19 |
| $\mathbf{3}$ |  |  | - | 17 |
| $\mathbf{4}$ |  |  |  | - |

## Storage operations

- Storage - the physical containment of finished goods, raw materials, supplies or in process material
- Objectives:
- Maximize space utilization
- Maximize equipment utilization
- Maximize labor utilization
- Maximize accessibility of all materials
- Maximize protection of all materials
- Accounts for around 15\% of warehouse operating expenses
- In general, the smaller the handling unit, the larger the handling costs

## Storage operations

- Stock Keeping Unit (SKU) - The smallest physical unit of a product tracked by an organization

## Storage Layout Methods

- Dedicated Storage (fixed-location storage)
- Each SKU is assigned to a specific storage location or set of locations.
- Storage locations can be arbitrarily determined, such as part number sequence, or they can be determined based on the SKU's activity level (number of storages/retrievals per unit time) and inventory level.
- Number of storage locations is the sum of the maximum inventory level of each SKU.
- Space requirement - to store the maximum amount ever on hand
- Advantage: lower handling costs
but requires more information, careful estimates and more management

## Storage Layout Methods

- Randomized Storage (random-location storage)
- An individual stock keeping unit (SKU) can be stored in any available storage location.
- Each unit of a particular product is equally likely to be retrieved when a retrieval operation is performed. Likewise each empty storage slot is equally likely to be selected for storage when a storage operation is performed.
- Retrievals are first-in first-out (FIFO)
- The quantity of items on hand is the average amount of each SKU
- Storage requirement not known, but upper bound can be computed
- Advantage: lower space costs

## Storage layout planning

- Principles of efficient storage planning
- Similarity
- Receiving, shipping and storing together
- Size
- Variety of storage location sizes
- Characteristics
- Perishable, crushable, hazardous items, etc.
- Space utilization
- Space conservation
- Materials accessibility
- Popularity
- Popular items close, in deep storage areas
- Receiving/shipping ratio

## Storage layout planning Principles - space utilization (accessibility)

Aisles should not be placed along walls without doors

Proper layout

Each storage face should have an aisle access

Majority of items should be stored along the long axis of the area

## Storage layout planning Principles - space utilization

- Honeycombing
- Wasted space that results because a partial row or stack cannot be utilized because adding materials would result in blocked storage.
Ceiling

Vertical honeycombing

Horizontal honeycombing

## Storage layout planning Principles - popularity

- Store the most popular items in a way that minimizes the travel distance
- Pareto law!
- $85 \%$ of the turnover will be a result of $15 \%$ of the materials stored

## Storage layout planning Principles - popularity

## Deep storage areas for popular items

| Distances from <br> reference point | 3 units | 2 units | 1 unit |
| :--- | :---: | :---: | :---: |
|  | 2 | 2 | 2 |
|  | 5 | 5 | 7 |
| Distance to A1 | 4 | 5 | 8 |
| Distance to B6 | 7 | 8 | 13 |
| Distance to B1 <br> Average travel <br> distance | 4.5 | 5 | 7.5 |

## Storage layout planning Principles - popularity

- Position based on the Receiving/Shipping Ratio

## Example

$\Rightarrow$ Determine the positions for the products A-H along the main aisle given the layout below and the following information:

| Product | Quantity per <br> Receipt | Trips to <br> Receive | Average <br> Customer <br> Order Size | Trips to <br> Ship |
| :---: | :---: | :---: | :---: | :---: |
| A | 40 pallets | 40 | 1.0 pallet | 40 |
| B | 100 pallets | 100 | 0.4 pallets | 250 |
| C | 800 cartons | 200 | 2.0 cartons | 400 |
| D | 30 pallets | 30 | 0.7 pallets | 43 |
| E | 10 pallets | 10 | 0.1 pallets | 100 |
| F | 200 cartons | 67 | 3.0 cartons | 67 |
| G | 1000 cartons | 250 | 8.0 cartons | 125 |
| H | 1000 cartons | 250 | 4.0 cartons | 250 |

- Calculate Receiving/Shipping Ratio for each item

| Product | Quantity per <br> Receipt | Trips to <br> Receive | Average <br> Customer <br> Order Size | Trips to <br> Ship | Receiving/Shipping Ratio |
| :---: | :---: | :---: | :---: | :---: | :---: |
| A | 40 pallets | 40 | 1.0 pallet | 40 | 1.0 |
| B | 100 pallets | 100 | 0.4 pallets | 250 | 0.4 |
| C | 800 cartons | 200 | 2.0 cartons | 400 | 0.5 |
| D | 30 pallets | 30 | 0.7 pallets | 43 | 0.7 |
| E | 10 pallets | 10 | 0.1 pallets | 100 | 0.1 |
| F | 200 cartons | 67 | 3.0 cartons | 67 | 1.0 |
| G | 1000 cartons | 250 | 8.0 cartons | 125 | 2.0 |
| H | 1000 cartons | 250 | 4.0 cartons | 250 | 1.0 |

- Rules of positioning the items in the warehouse:
- ratio < 1.00 => closer to shipping
- ratio > 1.00 => closer to receiving
- Position the items in order of importance of being close to shipping or receiving

Travel distance the same

## Warehouse layout model

- Quantitative model for determination of the location of products for storage and warehouse
- We assume
- Dedicated storage layout
- Rectilinear distances

## Warehouse layout model

## Warehouse layout model

## Location $\boldsymbol{k}$

- The objective is to minimize $f_{k}$ which is the expected distance traveled between storage location $k$ and the docks

## Warehouse layout model

- Procedure for warehouse design which minimizes the distance:

1. Number the products according to their $\mathrm{T}_{\mathrm{j}} / \mathrm{S}_{\mathrm{j}}$

$$
\frac{T_{1}}{S_{1}} \geq \frac{T_{2}}{S_{2}} \geq \cdots \geq \frac{T_{n}}{S_{n}}
$$

where $T_{j} \ldots \ldots$. number of in/out trips for product $j$
$S_{j} \ldots .$. .number of storage locations required for product $j$

1. Compute the $f_{k}$ values for all storage locations
2. Assign product 1 to the $S_{1}$ storage locations having the lowest $f_{k}$ values; assign product 2 to the $\mathrm{S}_{2}$ storage locations having the next lowest $f_{k}$ values; and so on....

## Warehouse layout model Example

- Warehouse given below has four docks. Docks P1 and P2 are for truck delivery ( $60 \%$ of the all the movement, with each dock equally likely to be used) and docks P3 and P4 are for rail delivery (remaining 40\% is equally divided between P3 and P4)
- There are 3 products A ( $3600 \mathrm{ft}^{2}$ with 750 loads per month), B ( $6400 \mathrm{ft}^{2}$ with 900 loads per month) and C ( $4000 \mathrm{ft}^{2}$ with 800 loads per month) which should be stored in the warehouse.
$B$ Design a warehouse layout

## Warehouse layout model Example

1. Number the products according to their $\mathrm{T}_{\mathrm{j}} / \mathrm{S}_{\mathrm{j}}$

- Number of storage bays required for each product:
$\mathrm{S}_{\mathrm{A}}=3600 / 400=9$
$S_{B}=6400 / 400=16$
$\mathrm{S}_{\mathrm{C}}=4000 / 400=10$
- Calculate $\mathrm{T}_{\mathrm{j}} / \mathrm{S}_{\mathrm{j}}$ for each product:
$\frac{T_{A}}{S_{A}}=\frac{750}{9}=83.33 ; \quad \frac{T_{B}}{S_{B}}=\frac{900}{16}=56.25 ; \quad \frac{T_{C}}{S_{C}}=\frac{800}{10}=80$
- Rank the products:

$$
\frac{T_{A}}{S_{A}} \geq \frac{T_{C}}{S_{C}} \geq \frac{T_{B}}{S_{B}} \Rightarrow \begin{aligned}
& \text { 1. A } \\
& \text { 2. C } \\
& \text { 3. B }
\end{aligned}
$$

## Warehouse layout model Example

2. Compute the $f_{k}$ values for all storage locations

$$
f_{k}=\sum_{i=1}^{m} p d_{k}
$$

$$
\begin{aligned}
& f_{1}=0.3 * 40+0.3 * 60+0.2 * 180+0.2 * 200=106 \\
& f_{29}=0.3 * 120+0.3 * 100+0.2 * 100+0.2 * 80=102
\end{aligned}
$$

| $106_{1}$ | $110_{2}$ | $114_{3}$ | $118_{4}$ | $122_{5}$ | $126_{6}$ | $130_{7}$ | $134_{8}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $86_{9}$ | $90_{10}$ | $94_{11}$ | $98_{12}$ | $102_{13}$ | $106_{14}$ | $110_{2}$ | $114_{16}$ |
| $76_{17}$ | $80_{18}$ | $84_{19}$ | $88_{20}$ | $92_{21}$ | $96_{2}$ | $100_{23}$ | $104_{24}$ |
| $86_{25}$ | $90_{26}$ | $94_{27}$ | $98_{28}$ | $102_{29}$ | $106_{30}=0.2$ | $110_{31}$ | $114_{32}$ |
| $106_{33}$ | $110_{34}$ | $114_{35}$ | $118_{36}$ | $122_{37}$ | $126_{38}$ | $130_{39}$ | $134_{40}$ |

## Warehouse layout model Example

3. Assign product 1 to the $\mathrm{S}_{1}$ storage locations having the lowest $f_{k}$ values; assign product 2 to the $S_{2}$ storage locations having the next lowest $f_{k}$ values; and so on....
4. A
5. C
$S_{A}=9$
$S_{C}=10$
6. B
$S_{B}=16$
